Simplifying Progress

SARTORIUS

Sartorius

A Reliable Partner

Sartorius is a leading international provider of integrated solutions for the biopharmaceutical industry. With our extensive portfolio of products, technologies and services, we cover wide areas of the biopharmaceutical process chain, ranging from fermentation, cell cultivation, filtration and purification to media storage and transportation.

Being the first industrial manufacturer of nitrocellulose membranes, Sartorius has developed an unmatched expertise in the production of various high quality nitrocellulose matrices.

Sartorius is...

... Committed to the Industry

Sartorius is the partner for developers and manufacturers of protein tests based on nitrocellulose substrate.

Our company continuously seeks to improving the membrane portfolio to support our customers looking for a high quality, reliable and cost effective manufacturing of their assays and tests.

... Focused on Quality

Our products are developed, produced and distributed according to a Quality Management that is certified in compliance with ISO 9001.

All products must pass Sartorius's precisely defined in-house tests and therefore meet Sartorius's stringent quality control standards throughout all manufacturing steps.

... the Technology Leader

In-depth know-how in nitrocellulose membrane manufacturing as well as relevant application expertise are driving us to continuously improve our state-of-the-art manufacturing equipment, located in Göttingen, Germany.

This continuous thrive for improvement is resulting in a reliable supply of high quality nitrocellulose membranes, serving the demanding diagnostic and life science markets.

Nitrocellulose

The Substrate of Choice for Protein Assays

The popularity of the UniSart® nitrocellulose membranes as a major component of many rapid tests has been built on their prominent features.

Features & Benefits

- Availability on Large Scale
- Wide Range of Applications
- High Protein Binding
- 3D Structure
The 3D microporous matrix allows liquids to flow in all directions
- High Consistency
High inter- and intra- lot consistency
- Excellent Performance
- Complete Traceability
- Reliable Supply
- Quality made in Germany

The UniSart® Product Portfolio

UniSart® CN Membranes for Lateral Flow Tests

When reliable capillary speed, homogenous thickness and defect-free surface quality need to be combined to obtain high quality lateral flow tests, then the UniSart® CN 95, CN 110, CN 140, CN 150 and CN 180 are the membranes of choice.

Please find more details and ordering information on page 8.

UniSart StructSure® Membranes for Multiplex Assays

These structured membranes have been developed through an innovative patterning process in order to better fulfill the need for rapid multiparameter tests.

Please find more information on page 14.

UniSart® CN Membranes for Blotting and Line Immunoassay

This format is used when many parameters need to be assessed for a particular disease on patient serum. Accordingly, the nitrocellulose membrane is printed with many lines or spots of different recombinant antigens to detect the corresponding antibodies in patient blood.

Please find more details and ordering information on page 18.

UniSart® Microarray Slides

On a UniSart® microarray slide, the multiplicity of protein spots displayed in a sophisticated pattern allow to look for various molecular interactions simultaneously. Therefore, protein arrays, considerably accelerate the quest for new drug targets and disease markers.

Please find more details and ordering information on page 22.

UniSart® CN Membranes for Lateral Flow Tests

Membranes for Lateral Flow Tests

The UniSart® membranes with large pores have been designed to be the best substrate for the 3 billion and more rapid lateral tests manufactured and used every year around the world.

The role of the nitrocellulose in a lateral strip is highly critical. The membrane acts as the main motor of the test, drawing the samples and conjugates from one end of the strip to the other one. Concurrently to their transport, the sample-conjugate

complex can be captured by the reagents that are nested on the test and control lines. The UniSart® membranes have been developed to offer the features essential for highly reproducible readouts.

Although the affinity of the different molecules is a pivotal factor, the capillary speed and the surface quality of the membrane are also crucial parameters for a sensitive test. The UniSart® membranes have been engineered in order to show a clean and defined porous structure that leads to a consistent lateral wicking of samples and reagents. Their smooth and defect free surface allows for a consistent dispensing of sharp capture and control reagents lines.

New state of the art machines enable the production of large batches of our different UniSart® membranes

with high consistency. From many square meters of one batch down to the few square centimeters of a lateral strip, our stringent QC and labelling allow for a consistent membrane with a precise traceability.

The UniSart® membranes will perfectly fit all diagnostic manufacturer production needs from thousand strips on manual cards to million strips on reel to reel equipment. All production steps including laminating, dispensing, drying, blocking, assembling and packaging are considerably improved when UniSart® membranes are used as revealed by the absolute final yields.

UniSart StructSure® Membrane

The innovative way to build your own multiparameter assay on nitrocellulose membrane with microfluidic design

Up to now, the features of nitrocellulose membranes have been essentially exploited in simple longitudinal strip or vertical flow through devices where the membrane is limited to simple rectangular or circular shape.

Sartorius has now developed a new technology to engraving different patterns into a nitrocellulose membrane. This innovative process leads to the creation of a hydrophobic barrier delineating the membrane zones. The remaining membrane stays fully functional.

Such a UniSart StructSure® membrane can act like a microfluidic device, the pump function being fulfilled by the natural capillary force of the membrane and the liquid being conveyed and restricted within a given path as the hydrophobic trenches prevent any overflow of the liquid. Multiple lanes network with separate reaction and mixing zones or complex lane network with joint reaction zones can all be created.

The UniSart StructSure® membrane can be produced and handled in a way compatible with the existing rapid test equipment. Moreover, various UniSart® nitrocellulose membranes used in lateral flow application are compatible with this innovative process.

Structure engraved in UniSart® membrane showing a clear cut between the erased and the remaining nitrocellulose membrane zones.

Multiparameter Lateral Flow Strip

To fulfill the needs for multiplex readout while keeping the simple rapid test format, manufacturers have developed lateral flow tests with manifold capture line across the strip.

These strips have a limited number of lines due to drawbacks like the decreasing of capillary flow speed with increasing distance from the origin, the modification of the sample after passage through the multiple lines and finally a loss of sensitivity with the depletion of conjugates. With the UniSart StructSure® membrane, a new generation of lateral flow strips can be created.

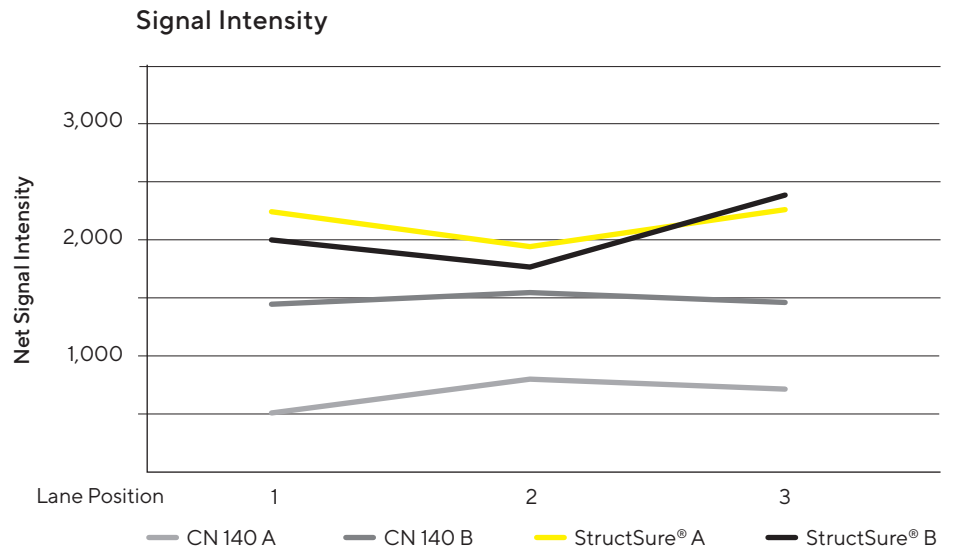

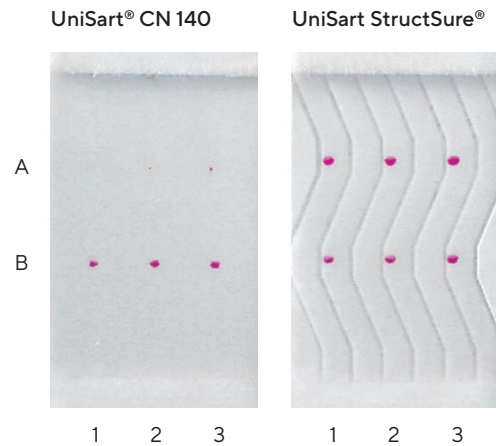

As shown in the example here included, a lateral flow membrane is designed with individual isomorphic lanes, each leading to separate test and control zones. In addition to enabling the positioning of individual reaction zones, the channeling of the liquid also has a positive impact on the generated signal intensity. Indeed, the hydrophobic barriers are likely to restrict the side flow of the reagents. UniSart StructSure® is currently available on a customized basis.

Example 1

The lateral flow strip prepared with the UniSart® membrane confirms that a significant decreased signal intensity is observed on capture spots positioned behind a first row of spots with the same capture reagents. This decrease is largely due to the loss of conjugate after the reaction on the first row.

In contrast, on the strip build with a UniSart StructSure® membrane, the downstream capture spots are showing the same signal intensity as the first row of spots. Thanks to the isomorphic lanes, the second row of capture spots has received the same amount of sample and conjugate as the first row.

- Significant decreased signal intensity on capture spots of row A compared to row B on UniSart® CN 140 membrane
- Capture spots show similar signal intensity on both rows with a UniSart StructSure® membrane

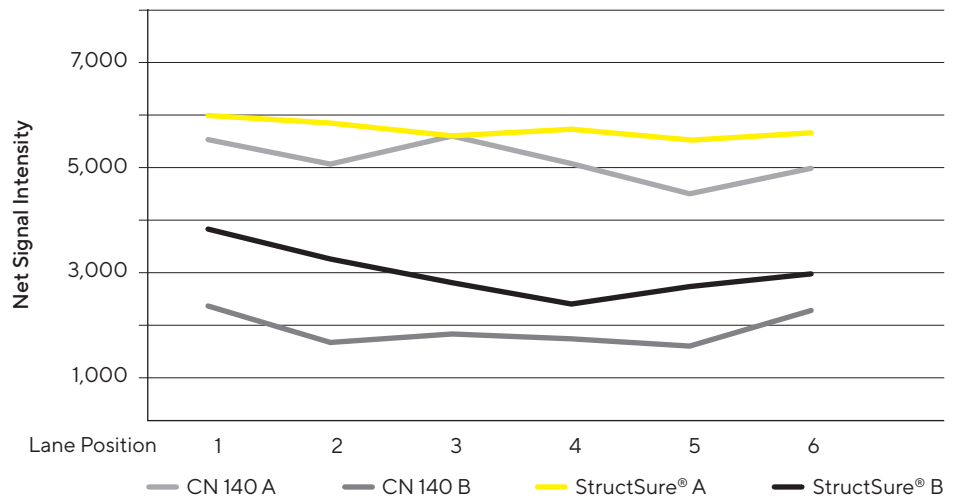

Example 2

In this second example, the test spots are in the first row and the control spots are in the second row of the strips. The capture spots positioned on the UniSart StructSure® membrane are showing increased intensity compared to the ones on the UniSart® membrane. Indeed, the restrictions in the liquid flow brought by the addition of individual lanes are assisting the binding of the conjugated particles on the reaction spots.

- Signal intensity increased in individual channel vs. inherent membrane
- Signal intensity homogenous in all 6 channels of UniSart StructSure® membrane
- The membrane zones that are individually served with native reagents facilitate a high quality readout for multiple parameters

Signal Intensity

If you have a new product that contains multiparameter readouts, we will be glad to realize the substrate for your needs. Contact us: UniSart@sartorius.com

UniSart® Membranes for Immunoassay and Blotting

Immunoassay

Line or dot blot strips are widely used for in vitro diagnostic tests. Many infectious diseases generate a complex immune response and require an antibody profiling of the patient serum. To do so, the different immuno-dominant antigens have to be applied in line or dots onto a uniform binding substrate. Today, long after the first membrane was used in blotting, the nitrocellulose membrane is still the best substrate for proteins.

The UniSart® 0.22 µm and 0.45 µm nitrocellulose membranes have been designed to show exceptional consistency in IVD blot strips.

Blotting

The UniSart® 0.22 µm and 0.45 µm membranes are well adapted to all protein blotting systems including electro transfer, semi-dry, vacuum or simple capillary blotting. They can be easily cut to the desired dimensions. Under the electrical field and the capillary drive, proteins move out of the gel into the UniSart® membrane which captures them instantly.

The staining of the transferred proteins can easily be done with methods like Ponceau S or SyproRuby staining. After protein transfer, the UniSart® nitrocellulose can be processed according to standard immunostaining protocols.

The antibody-antigen complex can be revealed on the membrane with different detection methods based on colorimetric, chemiluminescent and fluorescent signals. The label can be conjugated to specific molecules or even particles, similar to the one used in lateral flow immunoassays. Due to the production process, the non-supported nitrocellulose membranes like the UniSart® 0.22 µm and 0.45 µm, always present two different surfaces, the air and belt side. Each side shall be first evaluated to select the one of choice.

Scan Electron Microscope photo of the 0.22 µm membrane and 0.45 µm (@ 4000x)

Line and Dot Printing

Today, most markers of interest can be generated through recombinant techniques in a pure state and large quantities. Consequently, these proteins can easily be dispensed in line or dots onto the membrane rather than to be transferred from a gel. The smooth surface of the UniSart® 0.22 µm and 0.45 µm allows for an easy dispensing either with contact tips or non-contact nozzles, allowing for sharp lines or spots.

The UniSart® 0.22 µm and 0.45 µm membranes show an optimized structure for blotting. The small pore size membranes allow for a high protein binding capacity onto the sponge like 3D matrix. Furthermore, the high ratio of pores allow for a fast flow through the membrane.

Typical Parameter Value of the UniSart® 0.22 µm and 0.45 µm

UniSart® Blotting Membrane	0.22 µm	0.45 µm
Flow rate for water [ml]/(min. cm ² bar)]	27	70
Bubble point with water [bar]	4.4	2.4
Extractable content in water [%]	<1	<1
Thickness [µm]	120	130
Burst pressure [bar]	0.8	0.2
Wetting with water [secs]	<1	<1

Membrane wound with yellow interleaving protection paper between the membrane layers.
UniSart StructSure® membranes can also be designed on small pore size nitrocellulose
to create multiplex blot cards to better distinguish each test zone.

UniSart® Microarray Slides

UniSart® Microarray slides are engineered for consistent protein microarrays

UniSart® Microarray slides

For the new generation of protein arrays, Sartorius has developed glass slides coated with a thin microporous nitrocellulose membrane.

Nitrocellulose membranes are the substrate of choice when it comes to protein-based assays. Widely used in electrophoresis blotting techniques and new rapid diagnostic immunoassays, the classical nitrocellulose membranes needed to be reengineered to best fit the protein array applications.

The UniSart® Microarray slides have an optimized nitrocellulose membrane with:

- A high signal to noise ratio (>50) at very low protein concentrations (pg-fg)
- A very low background of the native array slide
- A perfect spot geometry

The inherent nitrocellulose properties like: a fast protein attachment without additional chemistry and a good preservation of functional structure as well as a high protein binding capacity per μm^2 add to the advantages of this particular substrate.

Modified glass surface has become the most widely used substrate for nucleic DNA arrays. However,

proteins are very different from nucleic acids. They are heterogeneous with limited stability while DNAs are uniform and stable. Proteins easily lose their activity through denaturation and dehydration as DNAs keep their activity even when denatured. In addition, protein chemistry is more complex with limited amplification methods available. All these differences support the needs of an alternative solid substrate for protein-based arrays.

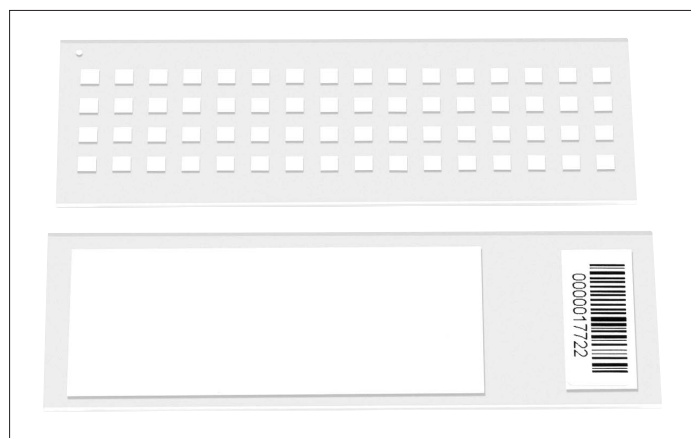

The UniSart® Microarray slides have been designed to be the best substrate for protein array application like:

Forward Protein Array (or Capture Protein Array)

Small amount of pure known proteins are spotted onto the slide. More than 15 000 active spots can be created. Once placed in contact with one sample, it will allow for the simultaneous reaction of the sample with all the spotted molecules.

Reverse Phase Protein Array (or Lysate Protein Array)

In a reverse phase protein microarray, multiple micro volume of cell lysate, tissue samples or even body fluids are spotted onto the slide. The reverse phase array is then incubated against one single specific marker, usually a high quality antibody.

After several years of development, a new manufacturing process has been designed. This new validated robotic equipment enables manufacturing the new UniSart® Microarray slides with an unmatched membrane consistency.

The new production process brings the following advantages:

- Tightest thickness specification with $\pm 1 \mu\text{m}$ maximum variation.
A constant thickness will allow for an homogeneous membrane structure and thus a uniform protein binding and spot morphology.
- Consistent and larger batches.
The new process enables the production of NC-coated slides on a continuous mode. This offers the guaranty for better intra- and inter lot consistency.

Specifications

Glass slide

Dimensions are the industrial standard in order to fit with instruments used by the microarray society.

Material: borosilicate glass

Dimension:

Thickness: $1 \text{ mm} \pm 50 \mu\text{m}$

Length: $75.6 \text{ mm} \pm 50 \mu\text{m}$

Width: $25.0 \text{ mm} \pm 50 \mu\text{m}$

Membrane pad

Material: Nitrocellulose

Thickness in μm : $12.5 \mu\text{m} \pm 2.5$

Wetting time (2 μl test solution): 180 s

Cleanness:

Slides are 100 % visually inspected and show a white membrane, free of macroscopic defects, without visible marks, stains, dust or foreign matter.

Pad dimension:

According format, tolerance $\pm 0.2 \text{ mm}$

UniSart® Nitrocellulose

Storage, Handling and Shelf Life

Storage and Handling

Keep away from open fire, any sources of heat, light and chemical vapours of any kind. Constant temperatures between 15 – 25°C and a relative humidity of maximum 60 % are best for storage and handling of the membrane. Very dry or humid storage conditions might alter the wettability and handling properties of the membrane. This change is only temporarily and can be overcome by conditioning the membrane at rel. humidity between 40 – 60 % for approx. 12 hours before processing the membrane.

After unpacking the membrane, please avoid any direct contact to the membrane. Please also avoid any direct contact of the membrane to materials that have the potential to release chemicals or additives into the membrane (e.g. cardboard, plastic ...). Adsorption or absorption of such substances may alter the membrane properties like wettability. Nitrocellulose membranes are highly flammable. Always keep the membrane separated by the interleaving paper as originally supplied. A material safety data sheet accompanies each shipment of material. Please make sure that the membrane is always handled according to local laws.

Shelf Life Information

For UniSart® nitrocellulose-based substrates, the shelf life is:

- UniSart® Membranes for Lateral Flow:
3 years after manufacturing
- UniSart® Membranes for Line Blot or Blotting
Application: 3 years after manufacturing
- UniSart StructSure® Membranes:
3 years after manufacturing
- UniSart® Microarray Slides:
1 year after manufacturing

The shelf life is clearly labelled as “use before” or “expiry date” on each Certificate of Analysis. The certificate accompanies each box of product. The shelf life is only guaranteed for originally packed material. Once the UniSart® Membrane | Microarray slide has been built into an OEM device or has been altered in any way, it is highly recommended that the manufacturer of such devices determines the shelf life of the final device.
